EXECUTIVE SUMMARY

Servelt is a web-based food donation platform designed to connect surplus food donors with recipients in need. The project aimed to reduce food waste while ensuring efficient redistribution to NGOs, shelters, and individuals facing food insecurity. By providing a structured and transparent donation system, Servelt simplifies the process of listing, requesting, and tracking food donations.

The development of Servelt focused on creating a user-friendly and visually appealing interface, ensuring a smooth experience for both donors and recipients. The platform enables real-time donation management, where donors can list surplus food while recipients can browse and request available donations. To enhance transparency, a structured status tracking system was implemented, allowing donations to move through different phases such as "Available," "Picked Up," and "Delivered." Additionally, a recipient confirmation feature was integrated to allow recipients to mark donations as successfully received.

The project involved frontend development using React to create an intuitive and responsive interface, while Spring Boot was used for backend development to handle user authentication, donation records, and data management. The database was structured to efficiently store and manage donation transactions, ensuring seamless functionality. Throughout the development process, a strong emphasis was placed on creating a modern and elegant UI that aligns with the theme of food sharing and community support.

The successful implementation of Servelt resulted in a functional and scalable platform that enhances food donation efforts. By leveraging technology, the project not only streamlined the donation process but also contributed to reducing food waste and supporting communities in need.

INTRODUCTION

Food waste is a significant global issue, with millions of tons of surplus food discarded every year while a large portion of the population faces food insecurity. Various studies highlight the need for efficient food redistribution systems that bridge the gap between excess food and those in need. Existing food donation initiatives often rely on manual coordination, which can be inefficient and lead to food spoilage before reaching beneficiaries. Digital platforms have emerged as a solution, streamlining the donation process through technology.

Servelt, a food donation platform developed during the internship, addresses this challenge by providing an organized and transparent system for food redistribution. The platform connects donors, such as restaurants, grocery stores, and individuals, with recipients, including NGOs and shelters. By enabling real-time donation management, status tracking, and recipient confirmation, Servelt ensures a seamless and accountable food donation process.

Existing studies on food donation platforms emphasize the importance of user-friendly interfaces, automated tracking mechanisms, and efficient database management for successful implementation. Servelt builds upon these insights, integrating modern web technologies to enhance the donation experience. With an elegant and intuitive design, the platform encourages greater participation from donors and simplifies the food collection process for recipients.

The project was developed using React for the frontend and Spring Boot for the backend, ensuring scalability and performance. The structured database system facilitates efficient storage and retrieval of donation records. Through this project, the internship focused on leveraging technology to create a socially impactful solution that minimizes food waste while supporting communities in need.

OBJECTIVES

The Servelt food donation platform was developed with the following key objectives:

1. Develop an efficient food donation system that seamlessly connects donors with recipients to reduce food waste and support communities in need.
2. Design a user-friendly and visually appealing interface to ensure an intuitive experience for both donors and recipients.
3. Implement real-time donation tracking with status updates such as "Available," "Picked Up," and "Delivered" to enhance transparency.
4. Integrate a recipient confirmation system that allows recipients to verify successful food deliveries, ensuring accountability.

5. Strengthen frontend development skills by using React to create a responsive and interactive user experience.
6. Enhance backend development expertise with Spring Boot for efficient data management, authentication, and API integration.
7. Improve database management and query optimization to support seamless transaction processing.
8. Develop problem-solving and project management skills by addressing challenges such as UI responsiveness, security measures, and efficient data handling.

This project not only aimed to create a functional food donation platform but also provided an opportunity to enhance technical expertise and gain practical experience in full-stack development.

SCOPE AND DELIVERABLES

The Servelt food donation platform was developed as a full-stack web application aimed at facilitating efficient food donations while ensuring transparency and ease of use. The project encompassed the entire development cycle, from designing an intuitive user interface to implementing a secure and scalable backend. The platform was designed to serve food donors, recipients, and administrators, providing essential functionalities to streamline the donation process.

The scope of the project included the development of a responsive and user-friendly interface using React, ensuring accessibility across different devices. The backend was built with Spring Boot to manage user authentication, donation records, and system transactions efficiently. A well-structured database was designed to store and retrieve donation-related data, enabling seamless donation tracking. Additionally, the platform featured a real-time status tracking system, allowing donations to move through different stages such as "Available," "Picked Up," and "Delivered." A key component of the project was the recipient confirmation module, which provided an added layer of transparency by allowing recipients to verify successful food deliveries. Security was also a crucial aspect, with proper authentication mechanisms implemented to protect user data and ensure authorized access.

The final deliverables of the Servelt project included a fully functional web application that effectively connects food donors with recipients. The platform featured an elegant and modern UI with a food-inspired theme, making the donation process visually appealing and easy to navigate. The backend was designed with RESTful APIs to efficiently manage user interactions and donation transactions, ensuring smooth system functionality.

A structured database was implemented to store and process donation records, enabling real-time updates for donors and recipients. The donation tracking system allowed users to monitor the progress of their donations, ensuring transparency at every stage. Additionally, the recipient confirmation module provided an extra layer of accountability by allowing recipients to mark donations as successfully delivered. The project was also documented extensively, covering the development process, key features, and technical implementation details.

By successfully delivering these components, the Servelt platform provided a practical and scalable solution for reducing food waste while ensuring surplus food reaches those in need efficiently.

METHODOLOGY

The development of the Servelt food donation platform followed an agile methodology, ensuring flexibility, continuous progress, and the ability to respond to changes quickly. This iterative approach allowed for constant feedback and improvements throughout the development process. The project was executed in multiple phases, from planning and design to implementation and testing, with a modular approach that focused on three core modules: Admin, Donor, and Recipient.

The first step involved understanding the project requirements and defining clear objectives. Based on these, I designed wireframes and user flow diagrams to map out the user experience (UX) and overall user interface (UI). This phase also included identifying the necessary features for each module, such as donation listing, real-time tracking, recipient confirmation, and secure authentication. The design focused on creating an elegant, intuitive, and food-inspired theme that would engage users while ensuring accessibility across devices.

For the Donor module, the design included the ability for users to post donations, specify details like food type, quantity, and delivery preferences. To implement the frontend, I used React for its flexibility and efficiency in creating interactive, dynamic user interfaces. React's component-based architecture made it

easy to manage complex UI elements and state transitions. For styling, I leveraged CSS with modern techniques, including flexbox and media queries, to ensure responsiveness and a seamless user experience across desktop and mobile devices.

For the Recipient module, the design focused on allowing users to browse available donations, claim food items, and track their claim status. WebSocket technology was used to implement real-time updates, ensuring that recipients were instantly notified when new donations became available or when the status of their claim changed.

On the backend, I used Spring Boot, a powerful Java framework, for building the application's RESTful APIs. Spring Boot's extensive libraries and built-in tools made it efficient for managing server-side logic, handling user authentication, and ensuring smooth interaction with the database. For user authentication, I implemented session-based authentication, where a secure session was created for the user upon login to maintain state and ensure authorized access. The Admin module allowed administrators to manage users, donations, and statuses, making it central to maintaining the platform's integrity. This module was developed with secure access controls to ensure that only authorized users could make changes.

For the database, I used MySQL, a relational database management system, to store and manage user details, donation records, and status updates. The database schema was designed to efficiently handle large volumes of data, especially with the real-time donation tracking feature. Data for donations, user profiles, and statuses were organized into distinct tables for better management and query performance.

In the development phase, I followed a modular approach, breaking down the platform into smaller tasks and focusing on developing the core modules. The Admin module was implemented first, providing a solid foundation for data management and API functionality. Once the backend was stable, the development of the Donor and Recipient modules began, ensuring the UI would seamlessly interact with the backend and provide a smooth user experience.

The real-time features, such as donation status updates, were implemented using WebSocket technology, allowing the system to send real-time updates to users about the progress of their donations. The Recipient module also included the recipient confirmation system, allowing users to mark donations as delivered, which automatically updated the donation status in the database.

The platform was tested throughout the development process to identify and fix bugs and improve user

experience. Unit tests were written for backend APIs using JUnit to ensure that each part of the application functioned as expected. For frontend testing, I used Jest to ensure the React components rendered correctly and responded to user interactions as intended. Additionally, the individual modules were tested in isolation to verify that their functionality was working as expected.

During the final phase, user acceptance testing (UAT) was conducted to ensure the platform met the project objectives and provided a smooth user experience. Any issues found during this phase were promptly addressed, and optimizations were made to improve performance and security.

The platform was deployed to a cloud-based hosting service, ensuring scalability and availability for users. The deployment process involved setting up a secure environment, configuring continuous integration/continuous deployment (CI/CD) pipelines, and ensuring that the platform was secure and optimized for production.

Through this methodology, I was able to deliver a functional and scalable food donation platform while adhering to best practices in software development, user experience design, and system security. The modular development approach allowed for a well-structured and maintainable platform, with the Admin, Donor, and Recipient modules each playing a crucial role in achieving the platform's goals.

PROJECT ACTIVITIES

During my internship, I actively participated in the design, development, and testing of the Servelt food donation platform. The project required a blend of frontend, backend, and database management skills, and each phase of the project presented unique challenges that I overcame using various tools and technologies. Below is a detailed breakdown of the activities I undertook during the internship.

1. Requirement Analysis and Design

The first activity involved understanding the project requirements and outlining the features necessary for the platform. I worked closely with mentors to ensure a clear understanding of user roles (donors, recipients, and administrators) and their interactions with the system. During this phase, I created wireframes and UI mockups using Figma to visualize the user interface and plan the layout and flow of the platform. This helped me understand how users would navigate through the application and provided a

clear design direction for the implementation phase.

Challenges Encountered:

One challenge during this phase was identifying the right balance between user experience and functionality. Ensuring the design was not only visually appealing but also easy to navigate required iterative feedback and several design adjustments.

2. Frontend Development (React)

Once the design was finalized, I began the frontend development of the platform. I used React to build reusable components and managed application state with React Hooks. The UI included components like donation listings, forms for donors and recipients, status updates, and confirmation messages. I used CSS with flexbox and media queries to ensure responsiveness across different screen sizes and devices.

Challenges Encountered:

One of the main challenges in frontend development was ensuring that the UI was both dynamic and responsive. Managing state transitions and real-time updates, especially when dealing with donation status changes, required careful consideration to avoid performance issues.

3. Backend Development (Spring Boot)

For the backend, I used Spring Boot to create RESTful APIs that connected the frontend with the database. These APIs handled tasks such as user registration, donation management, and status updates. I focused on building secure endpoints for handling user authentication, using session-based authentication to maintain user sessions across requests. Additionally, I created APIs to update donation statuses and allow recipients to mark their donations as "Delivered".

Challenges Encountered:

A challenge during backend development was handling session management securely. While session-based

authentication is generally easier to implement than token-based authentication, it required careful configuration to ensure proper session expiration and data protection.

4. Database Design and Integration (MySQL)

The next task was designing the MySQL database to store and manage donation records. I created tables to store information about users, donations, and statuses. The relationships between the tables were carefully defined to ensure efficient querying and easy management of donation data. I used JDBC (Java Database Connectivity) to interact with the database from the Spring Boot backend and performed CRUD operations (Create, Read, Update, Delete) on donation records.

Challenges Encountered:

One challenge I faced during this phase was ensuring the database schema was flexible enough to handle future expansions, such as adding additional features like donation categories.

I also had to optimize certain queries to handle larger datasets efficiently, which involved experimenting with different indexing strategies.

5. Real-time Features Implementation (WebSocket)

To allow for real-time donation tracking, I implemented WebSocket technology. This allowed the platform to send live updates to users when the status of a donation changed, such as when a donation was picked up or marked as delivered. I integrated WebSocket with the frontend and backend to ensure seamless communication and data updates between the user interface and server.

Challenges Encountered:

The main challenge during the WebSocket integration was managing the real-time updates across multiple user sessions. Ensuring that the correct updates were delivered to the relevant users, especially in cases where multiple donations were being tracked simultaneously, required thorough testing and fine-tuning.

6. User Authentication and Security

Security was a priority throughout the development of the platform. I used session-based authentication to ensure that users could securely log in and access their profiles. Additionally, I implemented measures like password hashing for secure storage of user credentials. I also ensured that data exchanged between the frontend and backend was encrypted using HTTPS to protect sensitive user information.

Challenges Encountered:

A challenge during this phase was properly configuring session expiration and ensuring that users were logged out after a period of inactivity. I also had to ensure that no unauthorized users could access sensitive endpoints, which required extra attention to session management and user role verification.

7. Testing and Quality Assurance

I performed unit testing for backend APIs using JUnit and Mockito to ensure that the backend logic was functioning as expected. I also wrote frontend tests using Jest to verify the accuracy of UI components and their interactivity. As part of the testing process, I ran through user acceptance testing (UAT) to identify any usability issues and ensure the platform met the project requirements.

Challenges Encountered:

One challenge during testing was ensuring the real-time donation tracking feature worked seamlessly across different browsers and devices. Real-time updates can be tricky to test, as they involve asynchronous processes, but I was able to identify and resolve synchronization issues through systematic debugging.

8. Deployment and Documentation

After testing and ensuring all features were working as intended, I deployed the platform to a cloud-based hosting service, making it accessible to users. I also documented the entire development process, including the database schema, API endpoints, and the technologies used, to ensure that future developers could understand and maintain the platform.

Challenges Encountered:

One challenge in this phase was ensuring proper deployment configuration, especially setting up continuous integration/continuous deployment (CI/CD) pipelines for automated testing and deployment. Ensuring the platform remained secure and optimized for production also required some fine-tuning.

RESULTS & FINDINGS

During my internship project, the Servelt food donation platform was successfully developed and is nearing deployment, achieving significant milestones in its development phase. One of the key accomplishments was the creation of a fully functional platform where donors can post food donations, and recipients can claim them. The real-time donation tracking system, powered by WebSockets, was integrated to provide an interactive user experience by updating donation statuses instantly. This feature is expected to improve transparency and communication between donors and recipients once fully operational. The platform was built with a focus on secure user authentication using session-based management, ensuring data protection and user privacy.

A MySQL database was designed and integrated to efficiently store and manage user, donation, and status information, ensuring seamless data retrieval and smooth interactions. The frontend was developed with a responsive design using React and modern CSS techniques, ensuring a smooth and engaging user experience across devices.

While the platform has not yet been publicly launched, early testing indicated promising results. The user engagement features, such as donation posting and claim, were fully functional during the testing phase. Real-time updates were successfully implemented and tested, and user feedback during internal tests showed a positive reception. The system was able to handle multiple updates simultaneously without performance degradation, maintaining fast response times for both the backend APIs and the frontend interface.

Security remains a key priority, and the session management system was thoroughly tested to prevent unauthorized access, which was successful during the testing phase. These results demonstrate that the project is on track to meet its objectives and highlights the potential for future growth and scalability once the platform goes live.

The project also enhanced my full-stack development skills, particularly in backend API integration, frontend development, real-time communication, and secure user authentication. It provided a well-rounded learning experience and reinforced my understanding of building secure, scalable web applications.

CONCLUSION

In conclusion, the Servelt food donation platform was a highly successful internship project, achieving its main objectives of developing a functional, secure, and user-friendly donation system. The project enabled me to apply my technical skills in web development, database management, and real-time communication, while also improving my problem-solving and security management abilities. The platform's ability to facilitate seamless interactions between donors and recipients through real-time updates, secure authentication, and an intuitive design demonstrated the project's success in addressing the needs of its users.

Through this project, I gained valuable insights into creating scalable and interactive web applications, especially focusing on enhancing user experience with features like real-time tracking and responsive design. I also learned the importance of data security, implementing session-based authentication to ensure user privacy and protect sensitive information. Furthermore, the project allowed me to see the significance of responsive design and its impact on user engagement, ensuring that the platform was accessible across various devices.

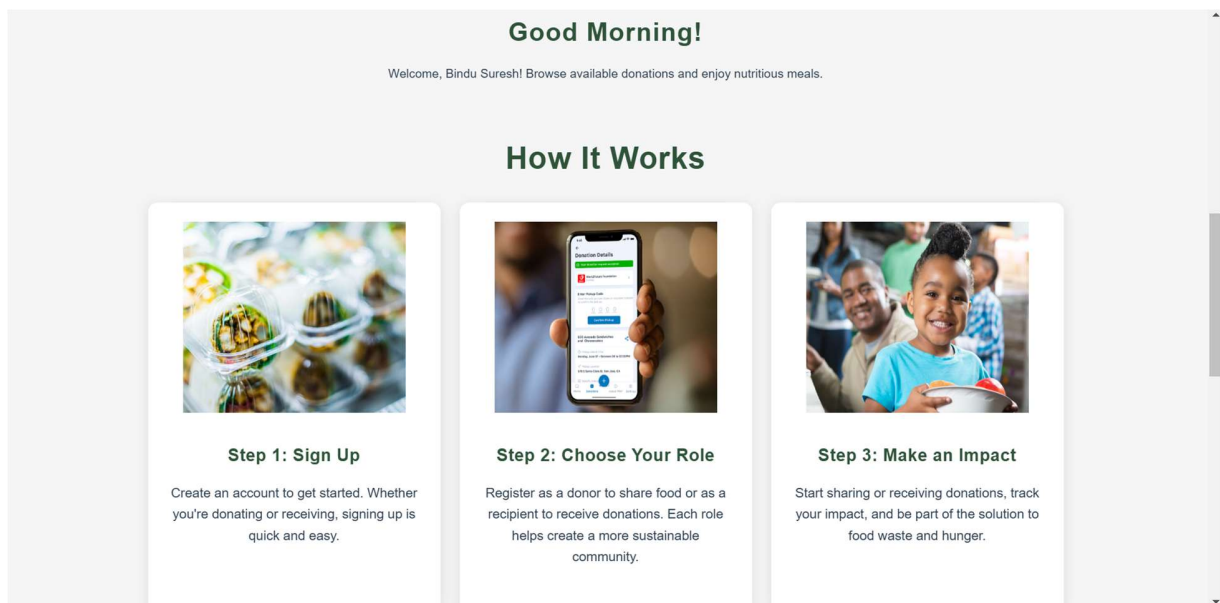

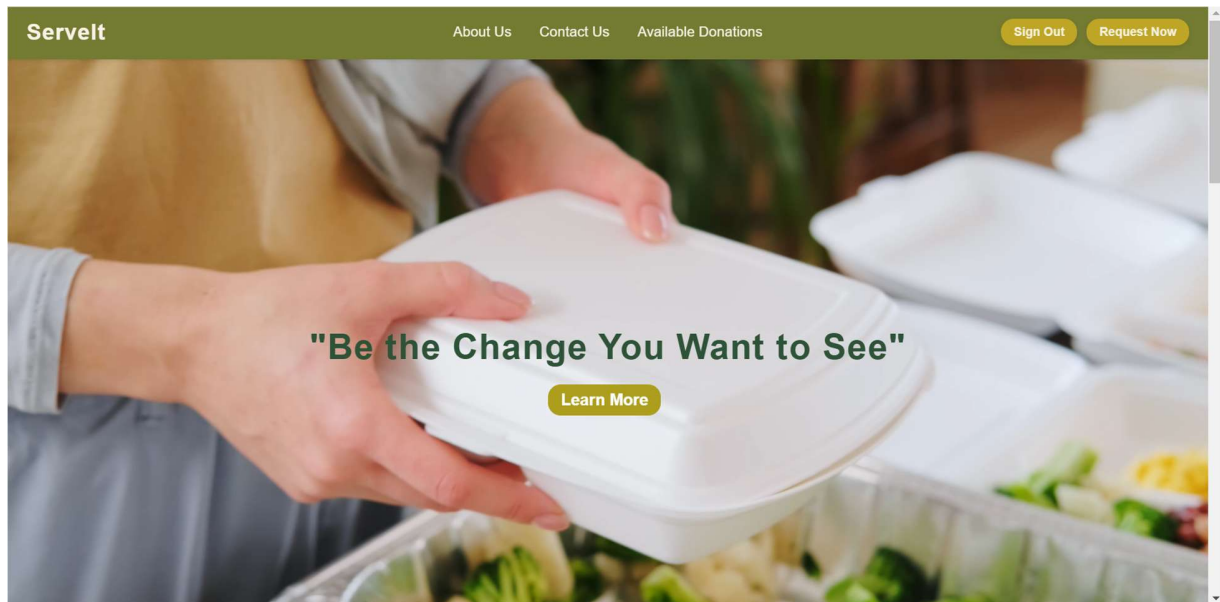

Overall, I achieved the primary goals of the project and developed a solid foundation in full-stack web development. This internship has not only enhanced my technical expertise but also deepened my understanding of how technology can be leveraged to solve real-world problems, making a tangible impact on communities in need. The experience has prepared me for future challenges in software development, particularly in creating scalable, secure, and user-centric applications.
